Title : Recent Data Concerning the Water Regime of Forage Plants of Virgin Soils in Stavropol'

Orig Pub : Tr. Stavropol'sk. s.-kh. in-ta, 1956, vyp. 7, 85-91

Abstract : In field conditions, there were determined the transpiration intensity, water content, water deficiency, residual water deficiency, water-exchange coefficient, water-retaining capacity, osmotic pressure of the cell sap, combinable water content, viscosity and elasticity of the protoplasm, plant resistance to heat, changes in chlorophyll content and durability of its bond with albumin. It was established that in steppe drought-

Card 1/3

USSR/Meadow Cultivation.

L

Abs Jour : Ref Zhur Biol., No 14, 1958, 63250

resistant plants, the variabilities of the intensity of physiological processes are determined by sudden changes in climatic, microclimatic and hydroedaphic factors of their environmental media. A broad amplitude of fluctuations of the water-exchange level and the water-retaining forces - in conformity with change of the drought factors, under the influence of the variability of which the relationship between the quantity of combinable water and the quantity of free water changes quickly - is characteristic for the typical virgin-soil plants. Notwithstanding the presence of a high transpiration intensity, a large content of colloido-combinable water is noted in the plants. As a reaction of the plants to drought, changes were observed in the chlorophyll content and the durability of its bond with albumin, in the ability to utilize, opportunely and more fully, the rain-fall moisture and in the endurance of protracted excess heat and

Title : Weed Vegetation in the Fields of Kursavskiy Rayon of the Stavropol' Kray in 1955.

Orig Pub : Tr. Stavropol' sk.s.-kh. in-to, 1956, vyp. 7, 161-171

Abstract : The calculation of the quantity of weeds covering the fields was effectuated in the experimental areas, according to Mal'zev's method. One hundred twenty three species of weeds (36.5 percent perennial, 9.9 percent biennial and 53.6 percent - annual) were registered in 33 sowings of winter wheat. The most frequently encountered weed species are enumerated. Various natural economic conditions of the northern, central and southern parts of the rayon are reflected by the nature of weed spread. The largest spread of weeds was found in the sowings of winter wheat in the northern part of the rayon on the rich chernozem soil with sufficient

TITLE:

On the Problem of Terrigenous-mineralogical Facies (K
voprosu o terrigenno-mineralogicheskikh fatsiyakh)

PERIODICAL:

Izvestiya vysshikh uchebnykh zavedeniy. Neft' i gaz, 1959, V. 2,
Nr 3, pp 5-10 (USSR)

ABSTRACT:

V. P. Baturin and the Dutchman Edelmann proposed in 1931 a provincial subdivision of terrigenous sediments according to their mineralogical composition. It was assumed herein that within such a terrigenous-mineralogical province the proportion between the individual kinds of detrital rocks is almost constant. Later investigations, especially by L. V. Pustovalov, proved, however, that within the zone of sediment formation a differentiation takes place. The causes of this differentiation are: the different mechanical and chemical resistance and forwarding capability as well as the structural type of the detrital rocks. Consequently the composition of a sedimentation zone changes according to a specific law of succession. This subdivision of the terrigenous-mineralogical province was termed by Pustovalov terrigenous-mineralogical facies. Being new, this term has not

Card 1/2

On the Problem of Terrigenous-mineralogical Facies

SOV/132-59-3-2/25

yet attained general application in research work. The present article tries to detect such facies in the Pliocene deposits of the oil district of Grozny by micropetrographical methods. The origin of the sediments under investigation is situated in the Caucasus, east of the Mt. Elbrus. The differentiation of the detrital rock can be proved distinctly in eastern and northeastern direction: sandrocks diminish in this direction while clay rocks increases. Above all, the change in the content of pyroxenes, hornblende and mica is a typical feature herein. The pyroxenes which amount to 80% in the western part of the region investigated diminish remarkably towards the east. There follows a facies where hornblende prevails, and finally the content of mica increases simultaneously with the content of stable minerals. These changes are plotted in this article and entered in a map. Thus three facies (pyroxenes, hornblende, mica) were proved in the region of sedimentation. There are 5 figures and 6 Soviet references.

Title : Weed Vegetation in the Fields of Kursvskiy Rayon of the Stavropol' Kray in 1955.

Orig Pub : Tr. Stavropol' sk.s.-kh. in-ta, 1956, vyp. 7, 161-171

Abstract : The calculation of the quantity of weeds covering the fields was effectuated in the experimental areas, according to Mal'zev's method. One hundred twenty three species of weeds (36.5 percent perennial, 9.9 percent biennial and 53.6 percent - annual) were registered in 33 sowings of winter wheat. The most frequently encountered weed species are enumerated. Various natural economic conditions of the northern, central and southern parts of the rayon are reflected by the nature of weed spread. The largest spread of weeds was found in the sowings of winter wheat in the northern part of the rayon on the rich chernozem soil with sufficient

TITLE : The Influence of the Direction Faced by the
Planting Rows on the Growth of Pine Cultures.

ORIG. PUB. : Tr. In-ta lesa. AN SSSR, 1958, 39, 133-145

ABSTRACT : This research was conducted in 1949-1951 in
12-13 year old pine cultures in Mikhnevskiy and
Zvenigorodskiy Leskhozoes in Moskovskaya Oblast.
At each leskhoz one laid out one trial patch
planted with pine running in the direction of
the rows from north to south and another trial
plot whose rows runs in the direction from west
to east. The method of studying the tree stand
and conditions of growth are described in detail.
The pine plantings with the direction of the

of the reaction at 80° was investigated by the study of the liberation of HCl , CO_2 and III. The chain mechanism of the reaction analogous to the reaction with benzoyl peroxide (RZhKhim, 1956, 9361) is proved. At concentrations of I less than 0.01 g.mol per lit, the length of the chain increases sharply with the decrease of the concentration, it depends little on I in more concentrated solutions. The chain lengths computed by HCl are less for I than for II, and computed by III - are greater for I than for II. The curve of the dependence of the liberation speed of HCl on the concentration of I at 55° is shown. The energy of the process activation is 25.8 - 0.5 kcal/mol.

The Rolling of Self-Bearing Sleeves in a Stiefel Mill. N. Kolpovskiy. (Istal, 1940, No. 3, pp. 29-30). (In Russian). The investigation which was carried out with steel NAKA15 containing carbon 1.0-1.1%, manganese 0.20-0.8%, silicon 0.18-0.33%, chromium 1.42-1.45%, nickel 0.13-0.16%, sulphur 0.007-0.010%, and phosphorus 0.013-0.016%, because of the unsatisfactory result obtained when rolling sleeves in a Stiefel mill showed that the billets should be heated slowly to 1150° C, with an arrest at 850-900° C. The reduction should not exceed 14-15%. The mandrel for piercing should be positioned in such a way that the formation of the hole occurs at the point of contact between the mandrel and the billet. The rolling should be finished at a temperature of 900-950° C. This should be followed by rolling the outside of the tubes in which all deformation should be finished at 850-880° C. The tubes should then be annealed at a maximum temperature of 840° C, followed by holding at 680° and 720° C. The structure and inner and outer surfaces of tubes produced in this way were satisfactory.

TITLE: Investigating the operation of a three-roll reduction mill

PERIODICAL: Referativnyy zhurnal. Metallurgiya, no. 6, 1961, 35, abstract 6D285 ("Byul. nauchno-tekhn. inform. Ukr. n.-1. trubn. in-t", 1959, no. 6 - 7, 48 - 57)

TEXT: The authors studied the operation of an 18-stand three-roll reduction mill for the purpose of establishing the rolling technology for both seamless and welded water-gas pipes under conditions of the Plant imeni Lenin. It was established that the combination of the former grooving of the rolls with kinematics of a three-roll reduction mill, makes it possible to obtain the necessary elongation only when reducing welded pipes of 2 and 1 1/2" diameter to 1" diameter. In the other cases the wall of the central pipe section is, after rolling, thicker than required by GOST 3262-55. The authors calculated and investigated new calibration of the rolls, for reducing pipes from 48 x 3.5 mm to

TITLE: Tubes with a corrosion resistant lining

PERIODICAL: Koks i khimiya, no.5, 1962, 48-49

TEXT: Tubes lined with vinyl and polyethylene plastics (tube diameter 2", thickness of lining about 3.5 mm) produced at the Dnepropetrovsk Tube-Rolling Mill were tested in the pyridine and sulphate plants of the Dnepropetrovsk Coal-Tar Chemical Works. The tubes were used for transportation of corrosive media of the following characteristics: acid solutions with various contents of sulphuric acid (0.5, 6 to 8, 30 to 40, 70 to 80%), in some cases crystals of ammonium sulphate were present; weakly alkaline solutions, containing pyridine bases, hydrogen sulphide, hypsulphite, thiocyanides, etc. The temperature of solutions were up to 50°C, the pressure did not exceed 2 to 3 atm. Tubes under these conditions have been in operation for two years and are still in service. For comparison, bimetallic (steel-copper) and

TITLE: Anodic-mechanical grinding of carbide tube-drawing dies ,

SOURCE: Metallurgicheskaya i gornorudnaya promyshlennost', no. 6, 1966, 31-33

TOPIC TAGS: metal cutting machine tool, electrospark machining, grinding machine, abrasive, die, metal tube, *METAL DRAWING*

ABSTRACT: In order to extend the life of tube drawing dies used at the Lenin works for drawing tubes up to 50-70 m/min, the ordinary alloy steels used for making the dies were replaced by the hard alloys VK-8, VK-10, and VK-15. Three anodic-mechanical methods were used to machine and polish the dies: anodic-mechanical, using an erosion process which removed large amounts of material but roughened the surface; electroabrasion, using an electrochemical process for cleaning the surface; and abrasion, using the working fluid without electric current. A schematic drawing (see Figure 1) of the technique showed the work (+) and tool (-) kept in contact with sodium silicate solution having a specific gravity of 1.23. The operation
